```

The present invention relates to a method for the site-specific integration of a DNA sequence into the plastid DNA of a plant or its derived cells. Transgenic plants in which a DNA sequence has been integrated, also their cell cultures, organs, tissues etc. are useful in human or animal nutrition, to produce seeds, and to produce pharmaceuticals or fine chemicals, e.g. enzymes, vitamins, amino acids, flavourings and aromatizing agents, dyes, antibodies and vaccines. The present sequence is a recognition sequence shown in the exemplification of the invention

German.

introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic
                                                                                                                                                                                                                                                                                        o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240
                                                                                                             cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 to ACC44732 and ABP96650 to ABP96657 represent sequences used in the

chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, trNA, rDNA, structural proteins, marker proteins, ligands, receptors, ibozymes, therapeutic proteins, and proteins, ligands, receptors, ibozymes, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (RAC). This producing plant artificial chromosomes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TITIACAGTAITATGTAGTCTGTITTTTAIGCAAAAICTAATTIAATATATATATTA 120

The sequences given in ABQ80304-05 are primers which were used to amplify DNA for use in the material of the invention. The primers amplify a 1377 DNA for use in the material of the invention. The principal of the invention of sequence (ABQ80306) was attached to the printer material of the invention which comprises at least one support having at least one oligomer and/or polymer applied on it. The printed material is useful in a method for synthesising DNA where the product of samplification and/or ligation is constantiation of nucleotide insertion/deletion, single nucleotide collympthism (SNP) and sequencing analysis, in a diagnostic method for determination of nucleotide insertion/deletion, or SNP analysis.

Optionally, the cDNA and/or full-length cDNA is useful for the peptide, optionally the cDNA and/or full-length cDNA is useful for the peptide, optionally applications, or for providing scientists with oligomer and/or polymers from the printed materials easily and immediately. From the printed materials and/or polymer and/or the polymers from the printed materials as all/or polymers can be obtained printed materials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  988 GCTTATCAATTTGTTGCAACGAACAGGTCACTATCAGTCAAATAAAATCATTATTTGAT 1047

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                              The present invention describes a method of removing a transgene marker by flanking the transgene with a bacteriophage lambda attachment P (attP) region and inducing homologous recombination between attP regions so that the transgene is removed. This is useful in the production of transgenic plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide and antibbotic resistance. The present sequence is the attb coding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  198

                                                                                                                                                                                                                                                                        oligomer and/or polymer applied on support. The support has oligomer and/or polymer applied on it, and is in the form of loose-leaf sheet or card. The support is useful for storing and/or delivering an oligomer and/or polymer applied on it. The present sequence is Bacteriophage lambda DNA used in the exemplification of the invention
                                                                                                                                                                                             New support useful for storing and/or delivering an oligomer and/or polymer applied on support, has oligomer and/or polymer applied on it, and a loose-leaf sheet or a card.

clone R280. An IEG is a grimulus e.g., neuronal stimulation. Such immediately following a stimulus e.g., neuronal stimulation. Such meronal IEGs have been found to encode a variety of proteins, including transcription factors, cytoskeletal proteins, growth factors and metabolic enzymes, as well as proteins involved in signal transduction. The identification of neuronal IEGs and the proteins they encode may provide important information about the function of neurons in, for example, learning, memory, synaptic transmission, tolerance and neuronal plasticity. Neuronal IEGs, neuronal IEG protein products, cells expressing neuronal IEGs, neuronal IEG proteins can be used to treat an animal with a deficiency is minimised. The costimuli, such that the effect of the deficiency is minimised. The costimuli, such that the effect of the deficiency is minimised. The neuronal stimulus comprises a maximal electroconvulsive seizure and its effects influence learning or memory. The IEGs and products are useful in identifying compounds that modulate the expression or are useful in identifying compounds that modulate the expression or

Also described: (I) a platform artificial chromosome catalysed recombination; and (2) a method (MI) for in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for chromosome. (I) can be used in gene therapy. (MI) is useful for chromosome, preferably an ACes. (II) is useful for producing a retificial chromosome, preferably an ACes. (II) is useful for producing a ratificial chromosome, preferably an ACes. (II) is useful for producing or artificial chromosome, preferably an ACes. (II) ipid-mediated transfection by a carrier system, microinfection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting chromosomes. The invention also relates to methods for targeting conserving the heterologous DNA into plant artificial chromosomes. The for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, ENNA, ENNA, structural proteins, marker proteins, liquads, receptors, ribozymes, therapeutic proteins, and control factors, antigens, hormones, crokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters contrologous nucleic acid is contained within a bacterial artificial chromosome (BAC). This properties are represented the DNA of a plasmid used in the marked of the plant of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DP-18.9. pAL261 comprises a replication origin active in E. coli, a selectable genetic marker which is a gene conferring resistance to ampicillin, sites for the restriction endonucleases BamHi and BglII with no essential sequences between them, and a third respriction site for PstI, located within the selectable marker which produces cohesive ends incompatible with those produced by BamHI and BglII. The polypeptide monomers are variants based on a consensus sequence derived from the fibre forming regions of spider dragline protein, esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. Synthetic analogues of DP1

protein and the pattern of variation among individual repeats. DP-1A malogues are composed of a tandemly repeated 101 amino acid monomer analogues are composed of a tandemly repeated 101 amino acid monomer which comprises four repeats which differ from the consensus sequence given in AAW06201, according to the pattern (1)-(5): (1) the poly-alanine sequence varies in length from 0-7 residues; (2) when the entire poly-alanine sequence is deleted, so also is the surrounding sequence. Calanine sequence is deleted, so also is the surrounding sequence. Caletions usually encompass integral multiples of three consecutive residues; (4) deletion of GXG is generally accompanied by deletion of GXG in the same sequence; and (5) a repeat in which the entire poly-alanine sequence is deleted is generally preceded by a repeat containing six alanine residues. The proteins may be used to produce fibres of high tensile strength and elasticity, suitable for clothing, rope, surgical sutures, biomaterials for implants, plastic reinforcements, films,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4822
                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of vector plasmid pJMF3, which includes phage lambda attP and the lac promoter with the first 21 amino acids of lacZ-alpha (from plasmid pUC19) fused in-frame to the Vibrio harveyi chitobiase gene (see AABD0484). The invention relates to genetic constructs and methods of using a cytoplasmic form of chitobiase enzyme as a reporter. A claimed reporter gene construct comprises pJMF3. The invention also comprises expression vectors which express the cytoplasmic
                                                                                                                                                                                                                                                                        Identifying a regulatory element capable of directing or regulating transcription (e.g. a promoter) comprises providing a construct linked to a nucleic acid encoding a cytoplasmic form of chitobiase.
                                                                                                                                                                                                                                                                                                                                                                                                                                       form of chitobiase. Methods are provided for: characterizing a promoter; identifying a regulatory element capable of directing and regulating transcription within a test sequence; detecting a successful transformation; and for monitoring the activity of a promoter. Chitobiase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      has an advantage over beta-galactosidase as a reporter gene in that it is not necessary to engineer many host cells to lack reporter activity. Identifying a regulatory element capable of directing or regulating transcription (e.g. a promoter) comprises providing a construct linked to a nucleic acid encoding a cytoplasmic form of chitobiase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of vector plasmid pJMF4, which includes phage lambda attP and the lac promoter with the first 21 amino acids of lacZ-alpha (from plasmid pUC19) fused in-frame to the Vibrio harveyi chitobiase gene (see AAB20484). The invention relates to genetic constructs and methods of using a cytoplasmic form of chitobiase enzyme as a reporter. A claimed reporter gene construct comprises pJMF4. The invention also comprises expression vectors which express the cytoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transcription within a test sequence, detecting a successful transformation, and for monitoring the activity of a promoter. Chitobiase has an advantage over beta-galactosidase as a reporter gene in that it is not necessary to engineer many host cells to lack reporter activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a regulatory element capable of directing or regulating transcription (e.g. a promoter) comprises providing a construct linked to a nucleic acid encoding a cytoplasmic form of chitobiase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   claimed reporter gene construct comprises pDYK9. The invention relates to genetic constructs and methods of using a cytoplasmic form of chitchiase enzyme as a reporter. The invention also comprises expression vectors which express the cytoplasmic form of chitchiase. Methods are provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of vector plasmid pDYK9, which comprises the Vibrio harveyi chitobiase gene under the control of the Escherichia colidnah promoter in plasmid pACYC184. pDYK9 was used to assess the regulation of the dnah gene using chitobiase as a reporter enzyme. The present sequence is that of vector plasmid pDXXII, which comprises the Vibrio harveyi chitobiase gene under the control of the Escherichia coli rpmH-dnah promoter in plasmid pACYC184. The plasmid encodes a dnah-chitobiase fusion protein (see AAB20485). It was used to assess the regulation of the dnah gene using chitobiase as a reporter enzyme. A calaimed reporter gene construct comprises pDXXII. The invention relates to genetic constructs and methods of using a cytoplasmic form of chitobiase enzyme as a reporter. The invention also comprises expression cotors which express the cytoplasmic form of chitobiase. Methods are provided for: characterizing a promoter, identifying a regulatory element capable of directing and regulating transcription within a test sequence; detecting a successful transformation; and for monitoring the activity of a promoter. Chitobiase has an advantage over beta-galactosidase as a reporter gene in that it is not necessary to engineer many host cells to lack reporter activity. (Updated on 11-SEP-2003 to standardise os field)

dev_stage="seedling"
/dov_stage="seedling"
/done_lib="Irradiated"
/note="Vector: Lambda Zap; Seedlings were exposed either
to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2. UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
----1 bwa from each sample. The cDNA was directionally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GSS 14-AUG-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Daborn, P.J., Bowen, D. and Blattner, F.R. A genomic sample sequence of the entomopathogenic bacterium Photorhabdus luminescens W14: potential implications for virulence Appl. Environ. Wicrobiol. 66 (8), 3310-3329 (2000)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         353 TATAAAAAGCATTGCTTATCAATTTGTTGCAACGAACAGGTCACTATCAGTCAAAATAA 294
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ford RNA from each sample. The cDNA was directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-Zap XR vector using ExAssist helper phage and the E. coli strain XLI-Blue MRF' (Stratagene). Excised plasmids were plated using SOLR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bacteria, Proteobacteria, Gammaproteobacteria, Enterobacteriales, anterobacteriaceae, Photorhabdus.

/clone gy gamma or 0.5.1,5,0 rs 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12,24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Strategene) and
packaged using the Gispack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-ZAP XR vector using ExAssist
helper phage and the B. coli strain XLI-Blue MRF'
(Strategene). Excised plasmids were plated using SOLR
cells."
